- FUNCTION: ACTURS ARE HIGHLY CONSERVED PROTEINS THAT ARE INVOLVED IN VARIOUS TYPES OF CELL MOTILITY AND ARE UBIQUITOUSLY EXPRESSED IN ALL EUKARYOTIC CELLS.
- SUBCELLULAR LOCATION: CYTOPLASMIC.
- MISCELLANEOUS: ON THE 2D-GEL THE DETERMINED PI OF THIS PROTEIN IS: 6.8, ITS MW IS: 46 KDA.
- SIMILARITY: BELONGS TO THE ACTIN FAMILY.
                             SEQUENCE.

Crystal structure and molecular conformation of achatin-I

(H-Gly-D-Phe-Ala-Asp-OH), an endogenous neuropeptide containing a
D-amino acid residue. ",

Int. J. Pept. Protein Res. 39:258-264(1992).

--- FUNCTION: NEUROEXCITATORY PEPTIDE; INCREASES THE IMPULSE FREQUENCY
AND FRODUCES A SPIKE BROADENING OF THE IDEMITIEDE HEART EXCITATORY

NEURON (PON); ALSO ENHANCES THE AMPLITUDE AND PREQUENCY

HEART BEAT. HAS ALSO AN EFFECT ON SEVERAL OTHER MUSCLES.

PIR; A32480; A32480.

A.Title: Isolation, primary structure and synthesis of leucokinins VII and VIII: the fin A.Title: Isolation, primary structure and synthesis of leucokinins VII and VIII: the fin A.Molecule type: protein
A.Molecule type: protein
A.Molecule type: protein
A.Molecule type: Leucokinins, a family of cephalomyotropic peptide
C.Comment: Leucokinins, a family of cephalomyotropic peptide
C.Keywords: amidated carboxyl end; cephalomyotropic peptide
F.8/Modified site: amidated carboxyl end (Gly) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

T-cell receptor beta chain V-D-J region (126-1BD) - mouse (fragment)
C; Species: Mus musculus (house mouse)
C; Species: Mus musculus (house mouse)
C; Date: 17-Jul-1992 #sequence_revision 17-Jul-1992 #text_change 30-May-1997
C; Accession: PT0557
R; Feeney, A.J.
J. Exp. Med. 174, 115-124, 1991
A; Title: Junctional sequences of fetal T cell receptor beta chains have few N regions A; Reference number: PT0509; MUID:91277601
A; Rittle: Junctional sequences of A; Reference number: PT0509; MUID:91277601
A; Reference number: PT0557
A; Status: translation not shown
A; Molecule type: mRNA
A; Residues: 1-8 CFEE
A; Experimental source: day 18 fetal thymus, strain BALB/C
C; Keywords: T-cell receptor
                                                                                                                                                                                                                                                                                                                                                                                  phosphatidylethanol amine-binding protein - mouse (fragment)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                            or antigonists (Tb) of human carefuncembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA responses. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                   The present invention describes peptides (A) that comprise agonists (Ia)

or antagonists (TD) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                             present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Carcinoembryonic antigen; CEA; human; agonist; antagonist; minumue response; carcinoma; gastrointestinal; breast; pancreatic; bladder; ovarian; lung; prostatic; T cell proliferation; cancer; adoptive transfer therapy; autoimmune reaction; immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
Peptide agonists and antagonists of carcinoembryonal antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 9;

immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and WHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC class I allele HLA-A2.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CEA synthetic peptide epitope 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       W77134 standard; peptide; 9 AA.

                                                                                                                                                                                                                The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatablilty complex; MHC; B cell; disease; anti-tumour; anti-viral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides W39430-W39734 are used in a novel method for the selection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method of selecting T cell peptide epitope(s) - by measuring the stability of HLA class I-peptide complexes on intact B cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Van Der Burg SH;

These peptides are are cysteinedepleted mutants of a native disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific immunospen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disease specific immunogen \cdot comprises disease specific cytotoxic T lymphocyte epitope used to elicit melanoma specific CTL response

carcinoembryonic antigen (CEA). The peptides can bind to a human leukocyte antigen (LEA). The peptides can bind to a human leukocyte antigen (LEA). The peptides can bind to a human leukocyte antigen (LHA), HHA-A2.1 and are used to exemplify the method of invention of producing antigen-specific cytotoxic T cells (CTLS) in vitro. The method comprises contacting immunogenic peptides from an antigen that binds class I major histocompatibility complex (MHC) molecules with antigen presenting cells (APCS) pretreated with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLs. A method for specifically killing trarget cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contacting the cytotoxic T cells with APCs pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CTLs which are contacted with a carrier to form a composition. The composition can then be administered to the patient. The activated CTLS can be used for treating cancers, immune disorders, viral infections, AIDS, hepatitis, bacterial infection, fungal infection, malaria or

Table 10 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human neukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) corpusorate cancer, hepatitis B and C, ALDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or antigonists (Tb) of human carefuncembryonal antigon (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to prollferate T cells, e.g. from vaccinated subjects; for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but GEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes peptides (A) that comprise agonists (Ia)

Peptides Y54171-Y54236 represent immunogenic peptides comprising an allele-specific binding motif for the major histocompatibility complex (MHC) molecule HLA, e.g. HLA-A2.1. The peptides have conserved residues at certain positions such as positions 2 and 9. Also, the peptides do not comprise negative binding residues at other positions, such as positions 1, 3, 6 and/or 7 (peptides 9 amino acids long) and at poisons 1, 3, 4, 5, 7, 8 and/or 9 (peptides 10 amino acids long). The peptides are used to induce a cytotoxic 7 cell response to a preselected antigen. The method comprises contacting cytotoxic 7 cells from a patient (optionally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 vivo. The resulting CTLS can be used to treat chronic infections (viral or bacterial) or tumours in patients that do not respond to conventional forms of therapy. The peptides may also be used to produce monoclonal antibodies, which are useful as potential diagnostic or therapeutic agents. The peptides may also be used as diagnostic reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                expressing a specific MIC class I allele) with the present peptides. The peptides are used to treat and prevent microbial infection (e.g. in viral hepatitis B and C. human papilomavirus (HPV) infection AIDS, cytomegalovirus (CMV), malaria, and condyloma acuminatum) and cancer (e.g. prostate cancer, renal carcinoma, cervical carcinoma, lymphoma). Patients in the acute phase of infection can be treated with the peptides in conjunction with other treatments. The antigenic peptides may be used to elicit cytotoxic T lymphocytes (CTLs) ex vivo and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                 or antagonists (ID) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA response. Cytotoxic T sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                         The present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

cells (CTC), comprises introducing a 1st pox virus vector, having at least 1 insertion site containing a DNA segment encoding a CEA peptide (i.e. the present peptide) to a host to stimulate CTC at least 1 insertion site containing a DNA segment encoding a CEA peptide (i.e. the present peptide) to a host to stimulate CTC production, and at least 1 periodic interval after that, contacting the host with an additional antigen. The CEA specific CTC can be used to determine the CTC eliciting epitope of CEA, and to screen for compounds which enhance the ability of the antigen to create a CTC response. A host with a CEA expressing tumour can be treated by introducing the CTC to the host, and at least 1 periodic interval after that introducing a CEA peptide, i.e. the present peptide. The present peptide is positive for binding to HIA-A2, and scored 561 and 806 in T2 cell binding assays, where the binding of an appropriate peptide results in the upregulation of surface HIA-A2 on the T2 cells, which can be quantified via FACScan using an anti-HIA-A2 antibody (background 280 and 300).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                        Generation of human cytotoxic T-cells specific for CEA - useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        carcinoembryonic antigen (CEA) specific human cytotoxic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                      feature whose relative abundance correlates with the presence or absence of RA; and (C) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic protein isoforms (RPIS), and for production of antibodies to RPIS. The RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy protocols. Y41844 to Y42100 represent RPI peptides y42101 to Y42103 represent expression reference protein isoform peptides and 225066 to 225068 represent dependent or protein isoform peptides and 225066 to 225068 represent dependent or protein isoform peptides and 225066 to 225068 represent PRID to WHIS, which are all used in
                                                                                                                                            A method has been developed for the diagnosis of human rheumatoid arthritis (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features: (b) identifying at least one chosen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mycobacterium tuberculosis; mycobacterial; methionyl-tRNA synthetase; enzyme; antibiotic; tuberculosis; Bacillus stearothermophilus.

Sequences shown in W70077 to W70086 represent methionyl-tRNA (Met-tRNA)

Synthetase fragments from different bacterial species. These are used
for designing degenerate primers (W4887 to W43800) used for isolating
Met-tRNA synthetase gene fragment by PCR from M. tuberculosis and M.

Kansasii. The invention provides an expression vector comprising a
nucleic acid encoding a mycobacterial aminoacyl-tRNAs (atRNA) (sepecially
Met-tRNA) synthetase under control of transcriptional signals that can be
used to transform suitable host cells. The nucleict acids and host cells
are used for the recombinant production of mycobacterial amino acyl tRNA
synthetases, especially of methionyl tRNA synthetase. The recombinant
classed by the organism in protein synthesis, and as such, the recombinant
enzyme can be used to identify candidate drugs for use as antiblotics
towards mycobacteria, especially M. tuberculosis, which is responsible
to tuberculosis. Antisense constructs of the nucleic acids can also be
used in antisense inhibition of the synthetase gene. The recombinant
enzyme allows quick assays in screening of antiblotics. Present testing
protocols involve exposing whole mycobacteria to candidate drugs and
seeing their effect. This is time consuming as the bacteria are generally
slow growing to the enzyme also prevents researchers from having to

                                                                                                                                                                                                                                                                                                                                                                                                                                      Turnitis (RA) using two-dimensional electrophoresis to generate a trivitis (RA) using two-dimensional electrophoresis to generate a diagnosis and prognosis of RA in a subject or for monitoring the effect diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally syno-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature of features in the sample indicates the presence or subsence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic protein isoforms (RPIS), and for production of antibodies to RPIS. The RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA-diagnostic acid encoding RADFs can be used in gene therapy concludes and expression reference protein isoforms peptides and 225066 to be concluded by the property of RPIS, which are all used in feature the processor the property of RPIS, which are all used in

T32 corresponds to a peak from the tryptic map of N-lipocortin, isolated from human placenta, on a Speed Vac Concentration. Amino acids 1 can also be G. Based on the similarity in the phospholipase A2 inhibitory activity of lipocortin and N-lipocortin and the similarity in the protein and sequences, it was concluded that the two proteins represent a family of related proteins. There is ca. 60% homology. The protein can be used for reducing inflammation or treating arthritic, allergic, dermatologic, opthalmic and collagen diseases and other diseases involving inflammation processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) bindong motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cesponse against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLs) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) critical susceptible or otherwise at risk of viral infection or individuals susceptible or otherwise at risk of viral infection or
                                                                                                                                                                              ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunogenic peptide having a human leukocyte antigen binding motif #1673

They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
antigen, either pWEL-17 or tyrosinase. The immunogen can be used in vaccines for protection against melanoma in mammals.

Such constructs are useful for the expression of the jojoba embryo long chain fatty acyl CoA reductase in host cells. The enzyme catalyses the formation of a fatty alcohol from a fatty acyl substrate. Analysis of the enzyme by SDS PAGE gave two prominent bands having apparent molecular masses of approximately 52 and 54 kb. As the apparent size of the reductase enzyme in the native state is approximately 49 kD as determined by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               size exclusion chromatography, these bands probably represented two related forms of the enzyme instead of two different subunits of the enzyme. This sequence is a peptide fragment from the 56 kD protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence encoding the jojoba embryo long chain fatty acyl-CoA reductase may be used in recombinant constructs which in turn can be used to transform E. coli. Such constructs are useful for the expression of the jojoba embryo long chain fatty acyl CoA reductase in host cells. The enzyme catalyses the formation of a fatty alcohol from a fatty acyl substrate. Analysis of the enzyme by SDS PAGE gave two prominent bands having apparent molecular masses of approximately 52 and 54 kb. As the apparent size of the reductase enzyme in the native state is approximately 49 kD as determined by size exclusion chromatography, these bands probably represented two related forms of the enzyme instead of two different submnits of the enzyme instead of two different submnits of the enzyme. This sequence is a peptide fragment from the 54 kb protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The anti-apoptotic tBAX proteins include tBAX70, tBAX78

and thair mituants. These proteins contain the N-terminal region and at least a portion of the BH3 domain of BAX alpha and lack the BH1, BH2 and C-terminal transmembrane domains. The tBAX protein lacking only the craminal transmembrane domains. The tBAX protein lacking only the craminal transmembrane domain has been shown to have anti-apoptotic activity.

The tBAX proteins are used to treat diseases associated with neuronal apoptosis, e.g. neurodegenerative diseases, peripheral nerve injury, spinal cord injury, head trauma and stroke. tBAX proteins

truncating at amino acid 68 of the BH3 domain of BAX alpha also have anti-apoptotic activity and is conserved in all BCL-2 family members.

The present sequence is a BH3 domain of mouse BAX protein, a pro-apoptotic protein belonging to BCL-2 family that is involved in creating the formal programmed cell death. The present sequence
                                                                                                                                                                                                                                                                                                                                                                       ó

```

```
derived from trehalose-6-phosphate (Tre6P) synthase from M. smegnatis. Tre6P is the key enzyme in the synthasis of trehalose via Tre6P. The aim of the invention is to produce a transgenic plant with increase trehalose content. Tre6P in M. smegnatis is heparin-activated and was isolated and purified. These peptides were derived from a protein which was purified with a mol. Wt. of 55 kb which shared antigenic determinants with the yeast Tre6P synthase protein. Using these peptides probes may be designed for the isolation of the Tre6P gene (TSP1) for the production of the transgenic plants. The trehalose may be isolated from the transgenic plants and used in bulk preparation including the preservation of the flavour and structure of food stuffs during drying. Fruits and berries form the transformed plants may be processed into purees, fallies and is and rich have a fresher and richer flavour due to the increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New transgenic plants with increase trehalose contents - prepd. by transforming plants with a trehalose-6-phosphate synthase gene fused to a non-constitutive promoter
ligands) on the surface of cells, and can associate with the beta-SU to form a heterodimer (also able to bind to ICAM-I). a-SU, and its derivs., are useful in suppressing inflammation, metastasis and growth of a-SU expressing tumour cells and is used in the treatment of viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tryptic peptide; trehalose-6-phosphate synthase; M. smegmatis; probe trehalose; transgenic plant; heparin-activated; preservation; food; antigenic determinant; yeast; TSP1; fruit; berry; puree; jelly; jam.

The progenitor AB sequence comprises amino acid residues of 16-21 of a stabilised synthetic PH domain (see W54310) of human cytohesin 1. The peptide library was generated by randomisation of AB and CD loop regions using randomised oligonucleotide primers (see W24929-399) of the peptide library are provided. Randomisation did not compromise the structural integrity and folding stability of the prodention of PH domain. The invention provides vectors that are used for the production of PH domain-like peptide libraries, which can be screened to identify peptides that have desirable properties, which can be of use in research or therapy, or as vaccines, Novel synthetic protein structural templates for the generation, screening and coultion of functional molecular surfaces are provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vectors used to produce PH domain-like peptide libraries - which are screened for therapeutically useful peptide(s), e.g. to produce

The first (RA) using two-dimensional electrophoresis to an extending and prognosis of Rain a subject or for monitoring the effect diagnosis and prognosis of Rain a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance of each chosen feature in the sample with the abundance of that chosen feature in the sample with the abundance of that chosen feature in the come or more persons without RA, where the relative abundance of the chosen feature in the sample come or more persons without RA, where the relative abundance of the chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method on also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy compounds that expression reference protein isoform peptides and 22566 to 225068 represent degenerate probes for RPIs, which are all used in the exemplification of the present invention.
                                                                                                                        A method has been developed for the diagnosis of human rheumatoid

tribules (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method.

Comprises: (a) analysing a sample of serum or plasma and optionally syno-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in the sample with the abundance of that chosen feature in the cone or more persons without RA, where the relative abundance of the chosen feature in the sample with the abundance of that chosen feature in the sample indicates the presence or chosen feature or features in the sample indicates the presence or studies for testing drugs for therapy of RA, for purification of RA-diagnostic feature (RADF) proteins on the used in clinical studies for testing drugs for therapy of RA, for purification of antibodies to compounds that promote or inhibit their activity, which are then used as Protein succods. Sequences shown in W70077 to W70086 represent methionyl-tRNA (Wet-tRNA)

Synthetase fragments from different bacterial species. These are used

for designing degenerate primers (V43887 to V43890) used for isolating

Met-tRNA synthetase gene fragment by PCR from M. tuberculosis and M.

Kansasii. The invention provides an expression vector comprising a

nucleic acid encoding a mycobacterial aminoacyl-tRNAs (atRNA) (especially

Met-tRNA) synthetase under control of transcriptional signals that can be

CC used to transform suitable host cells. The nucleict acids and host cells

are used for the recombinant production of mycobacterial amino acyl tRNA

Synthetases, especially of methionyl tRNA synthetase. The enzymes are

used by the organism in protein synthesis, and as such, the recombinant

c anzyme can be used to identify candidate drugs for use as antibiotics

towards mycobacteria, especially M. tuberculosis, which is responsible

CC towards mycobacteria, especially M. tuberculosis, which is responsible

CC towards mycobacteria constructs of the nucleic acids can also be

Cused in antisense inhibition of the synthetase gene. The recombinant

c arzyme allows quick assays in screening of antibiotics. Present testing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a human cancer-associated polypeptide plu-1. The plu-1 polypeptide can be recombinantly expressed by standard recombinant methodology. Detection of the plu-1 nucleic acid or the polypeptide is used for the following: (1) diagnosis (including imaging) and prognosis of, and determination of susceptibility to, cancer, specifically ovarian or breast cancer; and il) treating cancer (by inducing an immune response against cancer cells, e.g. as a vaccine, or by antisense inhibition). Antigens derived from the polypeptide are used to generate activated cytocoxic T lymphocytes, or dendritic cells, for subsequent return to the patient for treatment of cancer. The polypeptide may also be used to identify inhibitors of plu-1 activity. Fragments of the polypeptide, and

The plu-1 antigen is expressed more commonly in breast tumors than some known tumor antigens. Sequences Y55320-629 represent predicted peptides from the plu-1 polypetide which may bind to the human class I alleles B27, A2, A3 and All.

The invention relates to a human cancer-associated polypeptide plu-1. The plu-1 polypeptide can be recombinantly expressed by standard recombinant methodology. Detection of the plu-1 nucleic acid or the polypeptide is used for the following: (i) diagnosis (including imaging) and prognosis used for the following: (i) diagnosis (including imaging) and prognosis of, and determination of susceptibility to, cancer, specifically ovarian or breast cancer; and ii) treating cancer (by inducing an immune response against cancer cells, e.g. as a vaccine, or by antisense inhibition).

Contoxic I lymphocytes, or dendritic cells, for subsequent return to the patient for treatment of cancer. The polypeptide may also be used to dentify inhibitors of plu-1 activity. Fragments of the polypeptide, and antibodies raised against plu-1, are useful as assay and imaging agents, also therapeutically (to induce an anti-idiotype response or where conjugated to cytocoxic agents). The plu-1 antigen is expressed more commonly in breast tunnors than some known tunnor antigens. Sequences x 55320-629 represent predicted peptides from the plu-1 polypetide which may bind to the human class I alleles B27, A2, A3 and A11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                       having a human major histocompatibility complex (MHC) Class I (also having a human major histocompatibility complex (MHC) Class I (also having a human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen -bearing cells are normally induced by an antigen from of a peptide fragment bound are particularly important in the form of a peptide fragment bound are particularly important in tumour rejection and in fighthing viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) are prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also the used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The period of the immungentic particular and also the used to the immungent paperides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a bcl homology domain 3 (BH3 domain) of the invention, derived from a proapoptotic member of the BCL-2 family. The BH3 polypeptide can be used in a method for promoting apoptosis in a target cell, especially where the cell is a cancer cell a virus infected cell or an autoantibody producing cell. The BH3 polypeptide can be used in therapeutic compositions for freating disease including cancer, other lymphoproliferative conditions, arthritis, inflammation, and autoimmune diseases, which may result from the down regulation of cell death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The patent discloses specific truncated BAX (tBAX) proteins
which inhibit neuronal apoptosis induced by trophic factor deprivation.
The anti-apoptotic tBAX proteins include tBAX70, tBAX78
and their mutants. These proteins contain the N-terminal region and at
least a portion of the BH3 domain of BAX alpha and lacking only the
transmembrane domain. The tBAX protein lacking only the
transmembrane domain has been shown to have anti-apoptotic activity.
The tBAX proteins are used to treat diseases associated with neuronal
apoptosis, e.g. neurodegenerative diseases, peripheral nerve injury,
spinal cord injury, head trauma and stroke. tBAX proteins
truncating at amino acid 68 of the BH3 domain of BAX alpha also have
anti-apoptotic activity because Asp at position 68 is shown to be
important for BAX activity and is conserved in all BCL-2 family members.
The present sequence is a BH3 domain of human BAK protein, a
propopolic protein belonging to BCL-2 family that is involved in
regulation of neuronal programmed cell death. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Peptides Y54171-Y54236 represent immunogenic peptides comprising an allele-specific binding motif for the major histocompatibility complex callele-specific binding motif for the major histocompatibility complex common modecule HiA, e.g. HiA-A21. The peptides have conserved residues at certain positions such as positions 2 and 9 Also, the peptides do not comprise negative binding residues at other positions, such as positions (2 1, 3, 6 and/or 7 (peptides 9 amino acids long) and at polsons 1, 3, 4, 5, 7, 8 and/or 9 (peptides 9 amino acids long). The peptides are used to induce a cytocoxic T cell response to a preselected antigen. The method comprises contacting cytotoxic T cells from a patient (optionally expressing a specific MMC class I allele) with the present peptides. Cromprises contacting cytotoxic T cells from a patient (optionally expressing a specific MMC class I allele) with the present peptides. Crital hepatitis B and C, human papilomavirus (HPV) infection, AIDS, cytomagalovirus (CM), malaria, and condyloma acuminatum) and cancer (e.g. prostate cancer, renal carcinoma, cervical carcinoma, lymphoma). Crital hepatitis B and C, human papilomavirus (RPV) infection and in peptides in conjunction with other treatments. The antigenic peptides can be used to elicit cytotoxic T lymphocytes (CTLS) ex vivo and in cytor. The resulting CTLS can be used to treat chronic infections (viral conventional corns of therapy. The peptides may also be used to produce monoclonal antibodies, which are useful as potential diagnostic or therapeutic can expend to conventional corns of the peptides may also be used as diagnostic reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                 Novel HLA binding immunogenic peptides used to induce T cell activation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an enzyme inhibitor peptide used in the method of the invention to distinguish between t-PA and u-PA. The present invention describes a substrate subtraction library for the identification of peptide substrates selective between a first enzyme
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enzyme Inhibitor; t-PA; u-PA; chymotrypsin; serine protease; active; latent; substrate subtraction phage display peptide library; identification; kinase; phosphatase; serpin.
                                                                                                                    The present peptide was prepd. by chemical synthesis, on the basis of an amino acid sequence deduced from the DNA sequence of the cloned P. gingivalis fimbrillin gene described in J. Bacteriol, 170, 1658, 1988. The peptide inhibits the adhesion of P. gingivalis to saliva coated surfaces, and is therefore useful for preventing periodontitis by application to teeth and gums, esp. in dentifices, mouthwashes or topical formulations, or by admin. as a vaccine. In an assay to determine the effect of the peptide on Peptide resulted in a percentage binding inhibition of approx. 30 %.
                           Peptide inhibitor of Porphyromonas gingivalis adhesion to saliva coated surface - useful for preventing periodontitis by application to the teeth and gums esp. in dentifrices, mouth:washes or topical formulations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Substrate subtraction phage display peptide libraries – used to distinguish between active and latent forms of enzyme, e.g. serine
                                                                                                                                                                                                                                                                                                                                                                ó
